Application No.: 10/529,967

Office Action Dated: July 29, 2008

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently amended) An electrospray source, comprising:

a contiguous capillary for separating and electrospraying a fluid comprising analyte and

electrolyte, said contiguous capillary comprising:

a spray tip at one end of said capillary; and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte therethrough, wherein

the electrically conductive portion comprises pores of a size that permit passage of electrolyte

therethrough.

2. (Cancelled)

3. (Original) The electrospray source of claim 1, wherein the electrically conductive

portion is electrolytically conductive.

4. (Original) The electrospray source of claim 1, wherein the contiguous capillary

comprises fused silica.

5. (Original) The electrospray source of claim 1, wherein the spray tip has an opening

smaller than about 50 microns.

6. (Currently amended) The electrospray source of claim [[2]] 1, wherein the pores

permit passage of electrolyte ions having a molecular mass of less than about 300 g/mol.

7. (Currently amended) The electrospray source of claim [[2]] 1, wherein the pores at

least partially block the passage of analyte.

Page 2 of 16

Application No.: 10/529,967

Office Action Dated: July 29, 2008

8. (Original) The electrospray source of claim 7, wherein the pores completely block the

passage of analyte ions having a molecular mass of greater than about 100 g/mol.

9. (Original) The electrospray source of claim 1, wherein the electrically conductive

portion is affixed within a support structure, said support structure capable of holding a buffer

solution.

10. (Original) The electrospray source of claim 1, wherein the electrically conductive

portion of the capillary comprises at least about 1 mm of the length of the capillary.

11. (Original) The electrospray source of claim 1, wherein the electrically conductive

portion of the capillary has a wall thickness less than the wall thickness of the adjacent

capillary portion.

12. (Original) The electrospray source of claim 11, wherein the wall thickness of the

electrically conductive portion of the capillary is less than about 50 microns.

13. (Original) The electrospray source of claim 1, wherein the diameter of the spray tip

opening is smaller than inside diameter of the capillary.

14. (Currently amended) A contiguous capillary for electrospraying a fluid comprising

analyte and electrolyte, the capillary comprising:

an inlet end to supply fluid into the capillary;

a spray tip for spraying fluid out of the capillary; and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte therethrough, wherein

the electrically conductive portion comprises pores of a size that permit passage of electrolyte

therethrough.

Page 3 of 16

Application No.: 10/529,967 **Office Action Dated:** July 29, 2008

15. (Cancelled)

16. (Original) The contiguous capillary of claim 14, wherein the electrically conductive

portion is electrolytically conductive.

17. (Original) The contiguous capillary of claim 14, wherein the contiguous capillary

comprises fused silica.

18. (Original) The contiguous capillary of claim 14, wherein the spray tip has a diameter

opening of less than about 50 microns.

19. (Currently amended) The contiguous capillary of claim [[15]] 14, wherein the pores

permit passage of electrolyte ions having a molecular mass of less than about 300 g/mol.

20. (Currently amended) The contiguous capillary of claim [[15]] 14, wherein the pores at

least partially block the passage of analyte.

21. (Original) The contiguous capillary of claim 20, wherein the pores completely block

the passage of analyte ions having a molecular mass of greater than about 300 g/mol.

22. (Original) The contiguous capillary of claim 14, wherein the electrically conductive

portion is affixed within a support structure, said support structure capable of holding a buffer

solution.

23. (Original) The contiguous capillary of claim 14, wherein the electrically conductive

portion of the capillary comprises at least about 1 mm of the length of the capillary.

24. (Original) The contiguous capillary of claim 14, wherein the electrically conductive

portion of the capillary has a wall thickness less than the wall thickness of the adjacent

capillary portion.

Page 4 of 16

Application No.: 10/529,967

Office Action Dated: July 29, 2008

25. (Original) The contiguous capillary of claim 14, wherein the wall thickness of the

electrically conductive portion of the capillary is less than about 50 microns.

26. (Original) The contiguous capillary of claim 14, wherein the diameter of the spray tip

opening is smaller than the inside diameter of the capillary.

27. (Currently amended) An apparatus for conveying analyte ions into an analytical

instrument, the apparatus comprising:

a contiguous capillary, comprising:

an inlet end to supply a fluid into the capillary, said fluid comprising analyte and

electrolyte;

a spray tip to spray fluid out of the end of the capillary that is opposite to the inlet

end;

and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte therethrough, wherein

the electrically conductive portion of the capillary comprises pores of a size that permit

passage of electrolyte therethrough;

an electrode exterior to said electrically conductive portion, said electrode being in

electrically conductive contact with the fluid interior to said electrically conductive portion;

a spray counter-electrode in proximity to said spray tip, said spray counter-electrode

comprising an opening in fluid communication with the analytical instrument; and

a power supply connected to the electrode and the spray counter-electrode, said power supply

providing a spray voltage for generating an electrospray comprising analyte ions, whereby at

Application No.: 10/529,967

Office Action Dated: July 29, 2008

least a portion of the analyte ions are conveyed through said opening and into the analytical

instrument.

28. (Cancelled)

29. (Original) The apparatus of claim 27, wherein the electrically conductive portion of

the capillary is electrolytically conductive.

30. (Original) The apparatus of claim 27, further comprising:

a second electrode in electrically conductive contact with fluid upstream from the electrically

conductive portion of the capillary; and

a second power supply to produce an electrophoresis voltage between the electrode and said

second electrode to effect electrophoresis separation of the analytes within the capillary.

31. (Original) The apparatus of claim 27, wherein the second electrode is in

electrolytically-conductive contact with the fluid adjacent to the inlet end of the capillary.

32. (Original) The apparatus of claim 27, wherein the capillary further comprises a

second electrically conductive portion through which the second electrode is in electrically

conductive contact with the fluid, said second electrically conductive portion being located

upstream or downstream from the first electrically conductive portion.

33. (Original) The apparatus according to claim 27, wherein the analytical instrument is a

mass spectrometer or a mass analyzer.

34. (Cancelled).

35. (Withdrawn) A method of making a contiguous capillary suitable for separating and

electrospraying a fluid comprising analyte and electrolyte, the method comprising:

Page 6 of 16

Application No.: 10/529,967 **Office Action Dated:** July 29, 2008

providing a capillary having an inlet end and a spray tip end;

etching a portion of the capillary wall in proximity to said spray tip end to provide an electrically conductive portion of the capillary, said electrically conductive portion capable of blocking passage of analyte therethrough; and

forming a spray tip at the spray tip end of the capillary.

36. (Withdrawn) The method according to claim 35, wherein the electrically conductive portion comprises pores of a size that permit passage of electrolyte therethrough.

37. (Withdrawn) The method according to claim 35, wherein the electrically conductive portion is electrolytically conductive.

38. (Withdrawn) The method according to claim 35, wherein the capillary comprises fused silica.

39. (Withdrawn) The method according to claim 35, wherein the etching comprises contacting the portion of the capillary with an etching fluid capable of dissolving the capillary.

40. (Withdrawn) The method according to claim 39, wherein the etching fluid comprises hydrofluoric acid.

41. (Withdrawn) The method according to claim 35, wherein the etching is terminated as soon as an electric current is detected passing through the etched portion of the capillary wall.

42. (Withdrawn) The method according to claim 35, further comprising protecting the portion of the capillary wall from breakage.

43. (Withdrawn) The method according to claim 35, wherein the thickness of the portion of the capillary wall decreases during etching.

Application No.: 10/529,967

Office Action Dated: July 29, 2008

44. (Withdrawn) The method according to claim 43, wherein the thickness of the portion

of the capillary wall is less than about 50 microns after etching is completed.

45. (Withdrawn) The method according to claim 35, wherein the electrically conductive

portion of the capillary wall remains impermeable to electrolyte and analyte after etching.

46. (Withdrawn) A method of conveying a fluid comprising analyte and electrolyte into

an analytical instrument, the method comprising:

providing a contiguous capillary, comprising:

an inlet end to supply said fluid into said contiguous capillary;

a spray tip to spray fluid out of the capillary; and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte therethrough;

transporting said fluid through said contiguous capillary;

providing an electrode exterior to said electrically conductive portion, said electrode being in

electrically-conductive contact with the fluid interior to said electrically conductive portion;

providing a spray counter-electrode in proximity to said spray tip, said spray counter-

electrode comprising an opening in fluid communication with the analytical instrument; and

applying a spray voltage between said electrode and said spray counter-electrode to effect

electrospray ionization of the analyte exiting the spray tip, whereby at least a portion of the

analyte ions is conveyed into the analytical instrument.

47. (Withdrawn) The method according to claim 46, wherein the electrically conductive

portion comprises pores of a size that permit passage of electrolyte therethrough.

Application No.: 10/529,967

Office Action Dated: July 29, 2008

48. (Withdrawn) The method according to claim 46, wherein the electrically conductive

portion is electrolytically conductive.

49. (Withdrawn) The method according to claim 46, further comprising:

providing a second electrode in electrolytically-conductive contact with fluid upstream from

the electrically conductive portion; and

applying a voltage between said electrode and a second electrode to effect electrophoresis

separation of the fluid within the capillary.

50. (Withdrawn) The method according to claim 49, wherein the second electrode is in

electrically conductive contact with the fluid in proximity to the inlet end of the capillary.

51. (Withdrawn) The method according to claim 49, wherein the capillary further

comprises a second electrically conductive portion through which the second electrode is in

electrically conductive contact with the fluid, said second electrically conductive portion

being located upstream or downstream from the first electrically conductive portion.

52. (Withdrawn) The method according to claim 49, wherein the analytical instrument is

a mass spectrometer or a mass analyzer.

53. (Withdrawn) The method according to claim 49, wherein the spray voltage is at least

about 500 kV.

54. (Withdrawn) The method according to claim 49, wherein the electrophoresis voltage

is at least about 1kV.

55. (Withdrawn) A method of obtaining the mass spectrum of analyte molecules,

comprising:

providing a fluid comprising analyte molecules and electrolyte;

Application No.: 10/529,967

Office Action Dated: July 29, 2008

providing a contiguous capillary comprising:

an inlet end to supply said fluid into said contiguous capillary;

a spray tip to spray fluid out of the capillary; and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte molecules

therethrough;

transporting said fluid through said contiguous capillary;

providing an electrode exterior to said electrically conductive portion, said electrode being in

electrically conductive contact with the fluid interior to said electrically conductive portion;

providing a spray counter-electrode in proximity to said spray tip for producing an

electrospray comprising analyte ions, said spray counter-electrode comprising an opening in

fluid communication with a mass spectrometer;

applying a spray voltage between said electrode and said spray counter-electrode to effect

electrospray ionization of the analyte ions exiting the spray tip, whereby at least a portion of

the analyte ions enters the mass spectrometer through said opening; and

measuring m/z of the analyte ions within the mass spectrometer to provide the mass

spectrum.

56. (Withdrawn) The method according to claim 5 5, wherein the electrically conductive

portion comprises pores of a size that permit passage of electrolyte therethrough.

57. (Withdrawn) The method according to claim 55, wherein the electrically conductive

portion is electrolytically conductive.

Page 10 of 16

Application No.: 10/529,967 **Office Action Dated:** July 29, 2008

58. (Withdrawn) The method according to claim 5 5, further comprising:

providing a second electrode in electrically conductive contact with fluid upstream from the

electrically conductive portion; and

applying a voltage between said electrode and a second electrode to effect electrophoresis

separation of the fluid within the capillary.

59. (Withdrawn) The method according to claim 58, wherein the second electrode is in

electrolytically conductive contact with the fluid adjacent to the inlet end of the capillary.

60. (Withdrawn) The method according to 58, wherein the capillary further comprises a

second electrically conductive portion through which the second electrode is in electrically

conductive contact with the fluid, said second electrically conductive portion being located

upstream or downstream from the fist electrically conductive portion.

61. (Withdrawn) The method according to claim 58, wherein the second electrically

conductive portion comprises pores of a size that permit passage of electrolyte therethrough.

62. (Withdrawn) The method according to claim 60, wherein the second electrically

conductive portion is electrolytically conductive.

63. (Currently amended) A contiguous capillary, comprising:

an inlet end to supply a fluid into the capillary, said fluid comprising analyte;

a spray tip for spraying fluid out of the capillary; and

an electrically conductive portion of the capillary in proximity to said spray tip, said

electrically conductive portion capable of blocking passage of analyte therethrough, wherein

the electrically conductive portion comprises pores of a size that permit passage of electrolyte

therethrough.

Page 11 of 16

Application No.: 10/529,967 **Office Action Dated:** July 29, 2008

64. (Cancelled)

65. (Original) The contiguous capillary of claim 63, wherein the electrically conductive

portion is electrolytically conductive.

66. (Original) The contiguous capillary of claim 63, wherein the contiguous capillary

comprises fused silica.

67. (Original) The contiguous capillary of claim 63, wherein the spray tip has a diameter

opening of less than about 50 microns.

68. (Currently amended) The contiguous capillary of claim [[64]] 63, wherein the pores

permit passage of electrolyte ions having a molecular mass of less than about 300 g/mol.

69. (Currently amended) The contiguous capillary of claim [[64]] 63, wherein the pores at

least partially block the passage of analyte.

70. (Original) The contiguous capillary of claim 69, wherein the pores completely block

the passage of analyte ions having a molecular mass of greater than about 300 g/mol.

71. (Original) The contiguous capillary of claim 63, wherein the electrically conductive

portion is affixed within a support structure, said support structure capable of holding a buffer

solution.

72. (Original) The contiguous capillary of claim 63, wherein the electrically conductive

portion of the capillary comprises at least about 1 mm of the length of the capillary.

73. (Original) The contiguous capillary of claim 63, wherein the electrically conductive

portion of the capillary has a wall thickness less than the wall thickness of the adjacent

capillary portion.

Application No.: 10/529,967 **Office Action Dated:** July 29, 2008

74. (Original) The contiguous capillary of claim 63, wherein the wall thickness of the electrically conductive portion of the capillary is less than about 50 microns.

- 75. (Original) The contiguous capillary of claim 63, wherein the diameter of the spray tip opening is smaller than the inside diameter of the capillary.
- 76. (Original) The contiguous capillary of claim 63, wherein the electrically conductive portion extends about 20 percent to about 50 percent around the circumference of the capillary.
- 77. (Original) The contiguous capillary of claim 63, wherein the electrically conductive portion extends completely around the circumference of the capillary.
